## 1.3.0

**Release Date:** 2013-09-20

**Maven:** <http://search.maven.org/#browse|161297726>

Add argument and exceptions to listeners and annotated listeners. The state or transition parameter let the method know which state or transition is processed by it. It is also possible to legally throw an exception of specified type instead of RuntimeException. All methods of listeners and processors throw their specified exceptions as well.

## Code Example

```

@FlowStateEvent
public void myStateListener(IFlowCarter<?> flowCarter, IFlowState state) throws
FlowStateListenerException {
    ...
}

@FlowTransitionEvent
public void myTransitionListener(IFlowCarter<?> flowCarter, IFlowTransition
transition) throws FlowTransitionListenerException {
    ...
}

```
